Dear Consumer

HIGH RISK BACKUP SYSTEM

Dear Sir/Madam,

99% of alarm systems around Australia primarily report their signals via a standard telephone line. Unfortunately, these lines are prone to attack.

Although there are a number of alternatives to standard dialers, we offer a two-way radio based alternative to our customers. We have been utilizing this system for over 10 years and have increased our network substantially to cover the Goldfields region.

The system is designed to be installed in areas where the primary alarm communication path is susceptible to interference or even where a telephone line is not available.

For further information regarding the Intellinet system, please don't hesitate to contact us.

Regards,

Anthony Meyers
Executive Director
